What is Short Bowel Syndrome or SBS?
Short Bowel Syndrome or SBS is a medical condition that affects people who have a sizable piece of their small intestine missing. The large intestine is sometimes called the large bowel, and the small intestine is sometimes called the small bowel. The small intestine and large intestine are parts of your digestive tract (see Figure 1).

People with SBS have trouble absorbing nutrients from food and drinks. Nutrients keep the body healthy and provide energy. Some examples of nutrients are vitamins, minerals, electrolytes, proteins, carbohydrates, and fats. Water is also a nutrient. Your body needs the right amount of water to keep working correctly.

SYMPTOMS OF SBS
Because people with SBS have trouble absorbing the right amounts of nutrients and water, they can develop symptoms. Not every person with SBS has the same symptoms, but some symptoms are more common than others.

In most patients, the main symptom of SBS is diarrhea. Other common symptoms include:
- Dehydration
- Malnutrition
- Weight loss
- Fatigue
- Excessive stomach or intestinal gas
- Oily, fatty, or sticky stool that can smell foul

What can I eat and drink?
Your health care team will give you specific oral diet recommendations that will help you digest and absorb as much as possible, in addition to stimulating your remaining intestine to grow. There are some general guidelines you can follow on what to eat and drink:
- Avoid concentrated sweets and fluids (for example, fructose, high fructose corn syrup, and sugar alcohols such as sorbitol)
- Chew foods well
- Eat 5 or 6 smaller meals per day
- Limit fluids with meals
- Eat solids before liquids at meals
- Limit or avoid alcohol and caffeine
- Limit fat intake to less than 30% of your diet; make protein about 20% to 30% of your diet; keep complex carbohydrates to more than 50% of your diet
- Eat foods with soluble fiber (for example, oatmeal, oat cereal, oat bran, lentils, apples, oranges, pears, blueberries, nuts, legumes, ground flaxseeds, chia seeds, carrots, psyllium, guar gum, pectin, and rinds)
- You may eat salty snacks
- Depending on your health care team’s recommendations, you may need to monitor your intake of water and other drinks
- Depending on your health care team’s recommendations, you may need to limit your intake of food that have a high concentration of a substance called oxalate: beets, spinach, rhubarb, strawberries, nuts, chocolate, tea, wheat bran, and all fresh, canned, or cooked dry beans
- Some foods that are good choices include the ones listed in Table 1 on page 2

ORAL REHYDRATION SOLUTIONS
Maintaining proper hydration is important when you have SBS. Talk with your health care team about hydration. They may recommend a specific oral rehydration solution if you are dehydrated. Some examples of recipes for homemade solutions are shown in Table 2 on page 2.

Is there anything I need to look out for with SBS?
Yes, SBS may cause complications in some patients. By keeping a lookout for symptoms of these complications, you can alert your health care provider early. Your health care provider can help you manage complications, which may help prevent them from becoming something more serious. Some common complications of SBS are shown on page 2 and in Table 3 on page 3.

Keep in mind, though, that not all patients with SBS will have all of these complications, and every patient will experience different symptoms to a different degree.

Notify your health care provider if you notice any new symptoms or a change in symptoms.
Table 1. Suggested foods.

<table>
<thead>
<tr>
<th>Starches/breads</th>
<th>Cereals</th>
</tr>
</thead>
</table>
| • Breads, pita bread, rolls | • Unsweetened cereals (wet or eaten dry as a snack) 
• Bagels, English muffins | • Hot cereals: cream of rice or wheat, grits, oatmeal 
• Plain waffles or pancakes | 
• Corn bread, plain muffins | 
• Tortillas—whole wheat or white flour, corn—toasted | 
• Pasta, macaroni, noodles | 
• Rice, brown rice, wild rice

<table>
<thead>
<tr>
<th>Vegetables</th>
<th>Fruits</th>
</tr>
</thead>
</table>
| • Canned or cooked vegetables | • Bananas, melons, unsweetened canned fruits (applesauce, pears, peaches, mandarin oranges, apricots, cherries) 
• Potatoes, sweet potatoes, yams | 
• Small amounts of lettuce (1/2 cup) |

<table>
<thead>
<tr>
<th>Meat/fish/poultry</th>
<th>Dairy/soy</th>
</tr>
</thead>
</table>
| • Meats, fish, shellfish, poultry, tuna fish | • Cheese, cottage cheese, plain yogurt or yogurt sweetened with artificial sweeteners, cream cheese 
• Plain soy milk |

Common complications of SBS

Bacterial overgrowth. SBS can result in an unusually high amount of bacteria in the small bowel because of undigested or unabsorbed food. It can also result when the ileocecal valve has been removed and bacteria from the large bowel can backflow into the small bowel. Bacterial overgrowth can cause acidosis (see Acidosis in Table 3).

The ileocecal valve connects the small and large intestines and normally blocks bacteria from the large intestine from flowing back into the small intestine (see Figure 2). Patients who have had their ileocecal valve surgically removed may be at greater risk for developing small bowel bacterial overgrowth. When the ileocecal valve is removed, the flow of bacteria between the large intestine and small intestine goes unchecked and more bacteria may get into the small intestine.

Symptoms of bacterial overgrowth include:

• Diarrhea
• Bloating
• Nausea
• Vomiting

Kidney stones. Kidney stones are solid masses made up of tiny crystals. Patients with SBS can develop kidney stones because they have decreased intestinal absorption of fats, calcium, and bile salts. Patients can have more than one kidney stone in the kidneys or in the tubes (also called ducts) leading from the kidneys that carry urine to the bladder (see Figure 3 on page 4).
Table 3. Other common complications of SBS.

<table>
<thead>
<tr>
<th>Complication</th>
<th>Description</th>
<th>Symptoms</th>
</tr>
</thead>
</table>
| Malnutrition                  | Malnutrition means that the body is not getting all the nutrients it needs in the right amounts, and this is causing problems in how the body normally functions. You can develop malnutrition even if only one nutrient is missing from your diet. | Symptoms of malnutrition are different, depending on what nutrients your diet is lacking. Common symptoms include:  
  - Fatigue  
  - Weight loss  
  - Dizziness  
  - Changes in skin, such as rashes and sores  
  - Changes in vision |
| Dehydration                   | Dehydration means that your body does not have enough water to function properly. Dehydration can be either mild to moderate, or severe. Diarrhea and vomiting can cause dehydration. You can also become dehydrated if you aren’t drinking enough water or other fluids because you feel sick or nauseated. | Signs of mild to moderate dehydration include:  
  - Thirst  
  - Dry or sticky mouth  
  - Not urinating much  
  - Darker yellow urine than usual  
  - Dry, cool skin  
  - Headache  
  - Muscle cramps  
  - Rapid heartbeat  
  - Breathing rapidly  
  - Feeling a lack of energy or interest in anything |
| Electrolyte abnormalities     | SBS can affect how well your body absorbs electrolytes. Electrolytes are minerals that help regulate important functions in the body. Examples of electrolytes are potassium, sodium, phosphorus, and magnesium. Normally, electrolytes are balanced in the body. When you have too much or too little of one or more electrolyte, you can develop different symptoms. | Symptoms of electrolyte abnormalities include:  
  - Irregular heartbeat  
  - Muscle weakness or muscle cramps  
  - Headache  
  - Nausea |
| Acidosis                      | Acidosis is a condition in which the level of acid in the blood is too high. People with SBS may sometimes produce more acid than normal or lose more bicarbonate than normal because of increased diarrhea. Acidosis can also result from abnormal growth of certain bacteria in the intestine (see Bacterial overgrowth on page 2). Notify your health care provider if your stool output increases or you experience symptoms of acidosis. | Symptoms of acidosis include:  
  - Confusion  
  - Blurred vision  
  - Slurred speech |
| Increased amounts of stomach acids | Patients with SBS often produce increased amounts of stomach acids. High levels of stomach acid can increase the amount of secretions entering the shortened bowel, which can interfere with normal absorption of nutrients. | Symptoms of increased stomach acids include:  
  - Diarrhea  
  - Abdominal pain  
  - Discomfort  
  - Nausea or vomiting |
| Vitamin and trace element deficiencies | SBS can affect how well your body absorbs vitamins and trace elements. Vitamins are necessary for metabolizing food in your body. Sometimes, your body doesn’t absorb enough of one or more vitamins, leading to vitamin deficiencies. Some vitamin deficiencies can cause serious problems, such as damage to the brain and nerves, confusion, and night blindness. Your body needs small but important amounts of trace elements, such as zinc, chromium, and manganese. | When deficiencies occur, you may experience such symptoms as skin rashes, muscle cramping, and irregular heart rhythms. It is important to catch vitamin and trace element deficiencies early. Your health care team will monitor you for them, but if you notice a change in how you feel, or you have increased fatigue, weakness, visual changes, skin rashes, or muscle cramps, or your heartbeat feels different, call your provider. |
How do I stay on track with treatment?

Staying on track with your treatment is the most important step you can take to improve your SBS symptoms, help your intestine regain function, and reduce your symptoms. Here are some tips to help you:

**Take your medications as your health care team instructs.** Medications are an important part of helping your intestines regain as much function as possible. Medications can also help manage your symptoms and enable you to live your life more fully. But medications work only if you take them as instructed. Some hints for remembering to take your medications include:

- Using pill boxes
- Setting alarms on your phone or computer, or using an alarm clock
- Keeping a medication calendar or diary that you check off every day

**Follow your prescribed diet.** Your health care team has designed a diet that will help your intestine recover function following surgery. What you eat and drink can also greatly influence what kind of symptoms you have, especially diarrhea, gas, nausea, and vomiting. Following your diet closely will not only help your intestine adapt and keep you as healthy as possible, it will help you manage gastrointestinal symptoms.

**Ask your health care team for other ideas and tips for staying on track with your treatment. They are there to help you.**
